Collaborators: Harald Pfeiffer[6] (Caltech), Jason D. Grigsby (WFU), & Matthew Caudill (WFU)
Motivation

- Black hole binaries are among the most likely sources for early detection with LIGO, VIRGO, GEO, TAMA, . . .
- Available computed waveforms should increase chance of detecting collision events.

Quasiequilibrium Binary Data

- General Relativity doesn’t permit *true* equilibrium for astrophysical binary systems.
- When the bodies are sufficiently far apart, the timescale for orbital decay is much larger than the orbital period.
- If the orbit is nearly circular (*quasi-circular*) then there is a *corotating reference frame* in which the binary appears to be at rest.
- Star (◊) Quasiequilibrium gives us a *physical condition* to guide us in fixing boundary conditions and data that is not otherwise constrained.
The 3 + 1 Decomposition

Lapse: $\alpha$  \quad Spatial metric: $\gamma_{ij}$
Shift vector: $\beta^i$  \quad Extrinsic Curvature: $K_{ij}$
Time vector: $t^\mu = \alpha n^\mu + \beta^\mu$

$$ds^2 = -\alpha^2 dt^2 + \gamma_{ij}(dx^i + \beta^i dt)(dx^j + \beta^j dt)$$

$$\gamma_{\mu\nu} = g_{\mu\nu} + n_\mu n_\nu \quad K_{\mu\nu} = -\frac{1}{2} \gamma^\alpha_\mu \gamma^\beta_\nu \mathcal{L}_n g_{\alpha\beta}$$

Constraint equations

$$\bar{R} + K^2 - K_{ij}K^{ij} = 16\pi \rho$$
$$\nabla_j \left( K^{ij} - \gamma^{ij} K \right) = 8\pi j^i$$

Evolution equations

$$\partial_t \gamma_{ij} = -2\alpha K_{ij} + \nabla_i \beta_j + \nabla_j \beta_i$$
$$\partial_t K_{ij} = -\nabla_i \nabla_j \alpha + \alpha \left[ \bar{R}_{ij} - 2K_{i\ell}K^\ell_j + KK_{ij} ight.$$ 
$$\left. - 8\pi S_{ij} + 4\pi \gamma_{ij} \left( S - \rho \right) \right]$$
$$+ \beta^\ell \nabla_\ell K_{ij} + K_{i\ell} \nabla_j \beta^\ell + K_{j\ell} \nabla_i \beta^\ell$$

Constraint equations

$$S_{\mu\nu} \equiv \gamma^\alpha_\mu \gamma^\beta_\nu T_{\alpha\beta}$$
$$j_\mu \equiv -\gamma_\nu^\mu n^\alpha T_{\nu\alpha}$$
$$\rho \equiv n_\mu n_\nu T_{\mu\nu}$$
$$T_{\mu\nu} = S_{\mu\nu} + 2n_{(\mu} j_{\nu)} + n_\mu n_\nu \rho$$
Conformal Thin-Sandwich Decomposition

\[ \gamma_{ij} = \psi^4 \tilde{\gamma}_{ij} \]

\[ K^{ij} = \frac{\psi^{-10}}{2\tilde{\alpha}} \left[ \left( \mathcal{I}_\beta \right)^{ij} - \tilde{u}^{ij} \right] + \frac{1}{3} \psi^{-4} \tilde{\gamma}^{ij} K \]

Hamiltonian Const.
\[ \tilde{\nabla}^2 \psi - \frac{1}{8} \psi \tilde{R} - \frac{1}{12} \psi^5 K^2 + \frac{1}{8} \psi^{-7} \tilde{A}_{ij} \tilde{A}^{ij} = -2\pi \psi^5 \rho \]

Momentum Const.
\[ \tilde{\nabla}_j \left( \mathcal{I}_\beta \right)^{ij} - \left( \mathcal{I}_\beta \right)^{ij} \tilde{\nabla}_j \tilde{\alpha} = \frac{4}{3} \tilde{\alpha} \psi^6 \tilde{\nabla}^i K + \tilde{\alpha} \tilde{\nabla}_j \left( \frac{1}{\tilde{\alpha}} \tilde{u}^{ij} \right) + 16\pi \tilde{\alpha} \psi^{10} j^i \]

Const. Tr(\(K\)) eqn.
\[ \tilde{\nabla}^2 \left( \psi^7 \tilde{\alpha} \right) - \left( \psi^7 \tilde{\alpha} \right) \left[ \frac{1}{8} \psi \tilde{R} + \frac{5}{12} \psi^5 K^2 + \frac{7}{8} \psi^{-7} \tilde{A}_{ij} \tilde{A}^{ij} - \psi^5 \beta^i \tilde{\nabla}_i K \right] = -2\pi \psi^5 K (\rho + 2S) - \psi^5 \partial_t K \]

\[ \tilde{A}^{ij} \equiv \frac{1}{2\tilde{\alpha}} \left[ \left( \mathcal{I}_\beta \right)^{ij} - \tilde{u}^{ij} \right] \]

Constrained vars: \(\psi, \beta^i,\) and \(\tilde{\alpha} \equiv \psi^{-6} \alpha\)

Freely specified: \(\tilde{\gamma}_{ij}, \tilde{u}^{ij} \equiv -\partial_t \tilde{\gamma}^{ij}\)

Quasiequilibrium \(\Rightarrow\)
\[ \begin{cases} 
\partial_t \tilde{\gamma}^{ij} = 0 \\
\partial_t K = 0 
\end{cases} \]
Equations of Quasiequilibrium

\[ \tilde{u}^{ij} = \partial_t K = 0 \]

\[ \Rightarrow \text{Eqns. of Quasiequilibrium} \]

Binary neutron star initial data require:

- boundary conditions at infinity compatible with asymptotic flatness and corotation.
  \[ \psi|_{r\to\infty} = 1 \quad \beta^i|_{r\to\infty} = \Omega_0 \left( \frac{\partial}{\partial \phi} \right)^i \quad \alpha|_{r\to\infty} = 1 \]

- compatible solution of the equations of hydrostatic equilibrium. \((\Rightarrow \Omega_0)\)

With \(\tilde{\gamma}_{ij} = f_{ij}\) and \(K = 0\), these equations have been widely used to construct binary neutron star initial data\([2, 11, 3, 14]\).
Equations of Quasiequilibrium

\[ \begin{aligned} \text{Ham. & Mom. const.} & \quad \text{eqns., & Const } \text{Tr}(K) \\ \text{eqn. from Conf. TS} & \quad + \tilde{u}^{ij} = \partial_t K = 0 \end{aligned} \]  \Rightarrow \text{Eqns. of Quasiequilibrium}

With \( \tilde{\gamma}_{ij} = f_{ij} \) and \( K = 0 \), these equations have been widely used to construct binary neutron star initial data\[2, 11, 3, 14].

Binary neutron star initial data require:
- boundary conditions at infinity compatible with asymptotic flatness and corotation.
  \[ \begin{aligned} \psi|_{r \to \infty} &= 1 \\ \beta^i|_{r \to \infty} &= \Omega_0 \left( \frac{\partial}{\partial \phi} \right)^i \\ \alpha|_{r \to \infty} &= 1 \end{aligned} \]
- compatible solution of the equations of hydrostatic equilibrium. (\( \Rightarrow \Omega_0 \))

Binary black hole initial data require:
- a means for choosing the angular velocity of the orbit \( \Omega_0 \).
- with excision, inner boundary conditions are needed for \( \psi, \beta^i, \) and \( \tilde{\alpha} \).

Gourgoulhon, Grandclément, & Bonazzola\[9, 10]\: Black-hole binaries with \( \tilde{\gamma}_{ij} = f_{ij} \) & \( K = 0 \), “inversion-symmetry”, and “Killing-horizon” conditions on the excision boundaries.

“Solutions” require constraint violating regularity condition imposed on inner boundaries!
The Inner Boundary

\[ s_i \equiv \frac{\bar{\nabla}_i \tau}{|\bar{\nabla}_\tau|} \]

\[ h_{ij} \equiv \gamma_{ij} - s_i s_j \]

\[ k^\mu \equiv \frac{1}{\sqrt{2}} \left( n^\mu + s^\mu \right) \]

\[ \dot{k}^\mu \equiv \frac{1}{\sqrt{2}} \left( n^\mu - s^\mu \right) \]

Extrinsic curvature of \( S \) embedded in spacetime

\[ \Sigma_{\mu \nu} \equiv \frac{1}{2} h^\alpha_{\mu} h^\beta_{\nu} \mathcal{L}_{k} g_{\alpha \beta} \]

\[ \dot{\Sigma}_{\mu \nu} \equiv \frac{1}{2} h^\alpha_{\mu} h^\beta_{\nu} \mathcal{L}_{\dot{k}} g_{\alpha \beta} \]

Extrinsic curvature of \( S \) embedded in \( \Sigma \)

\[ H_{ij} \equiv \frac{1}{2} h^k_i h^\ell_j \mathcal{L}_s \gamma_{k \ell} \]

Projections of \( K_{ij} \) onto \( S \)

\[ J_{ij} \equiv h^k_i h^\ell_j K_{k \ell} \]

\[ J_i \equiv h^k_i s^\ell K_{k \ell} \]

\[ J \equiv h^{ij} J_{ij} = h^{ij} K_{ij} \]

Expansion of null rays

\[ \theta \equiv h^{ij} \Sigma_{ij} = \frac{1}{\sqrt{2}} (H - J) \]

Shear of null rays

\[ \sigma_{ij} \equiv \Sigma_{ij} - \frac{1}{2} h_{ij} \theta \]

\[ \dot{\theta} \equiv h^{ij} \dot{\Sigma}_{ij} = -\frac{1}{\sqrt{2}} (H + J) \]

\[ \dot{\sigma}_{ij} \equiv \dot{\Sigma}_{ij} - \frac{1}{2} h_{ij} \dot{\theta} \]
AH and QE Conditions on the Inner Boundary

The quasiequilibrium inner boundary conditions start with the following assumptions:

1. The inner boundary $S$ is a (MOTS):
   \[ \theta = 0 \]

2. The horizons are in quasiequilibrium:
   \[ \sigma_{ij} = 0 \] and no matter is on $S$

   Raychaudhuri’s equation implies that MOTS initially evolves along $k^\mu$.
   \[
   \mathcal{L}_k \theta = \frac{1}{2} \theta^2 - \sigma_{\mu\nu} \sigma^{\mu\nu} - \omega_{\mu\nu} \omega^{\mu\nu} - R_{\mu\nu} k^\mu k^\nu = 0
   \]

3. The time evolution vector lies in outgoing null surface through $S$:
   \[ t^\mu k_\mu \big|_S = 0 \]
   \[
   k^\mu \equiv \frac{1}{\sqrt{2}} (n^\mu + s^\mu) \\
   t^\mu = \alpha n^\mu + \beta^\mu
   \]
   \[ \alpha \big|_S = \beta^i s_i \big|_S \equiv \beta_\perp \big|_S \]
AH/Quasiequilibrium Boundary Conditions

\[ \theta = \frac{\psi^{-2}}{\sqrt{2}} \left[ \tilde{h}^{ij} \tilde{\nabla}_i \tilde{s}_j + 4 \tilde{s}^k \tilde{\nabla}_k \ln \psi - \psi^2 J \right] \]

\[ \sigma_{ij} = \frac{1}{\sqrt{2}} (H_{ij} - \frac{1}{2} h_{ij} H) \left( 1 - \frac{\beta_1}{\alpha} \right) \]

\[ - \frac{1}{\sqrt{2}} \frac{\psi^4}{\alpha} \left\{ \tilde{D}_{(j} \beta_{i\|)} - \frac{1}{2} \tilde{h}_{ij} \tilde{D}_{k\|} \beta^k - \frac{1}{2} [\tilde{h}_{ik} \tilde{h}_{j\ell} \tilde{u}^{k\ell} - \frac{1}{2} \tilde{h}_{ij} \tilde{h}_{k\ell} \tilde{u}^{k\ell}] \right\} \]
AH/Quasiequilibrium Boundary Conditions

\[ \theta = \frac{\psi^{-2}}{\sqrt{2}} \left[ \tilde{h}^{ij} \tilde{\nabla}_i \tilde{s}_j + 4 \tilde{s}^k \tilde{\nabla}_k \ln \psi - \psi^2 J \right] \]

\[ \sigma_{ij} = \frac{1}{\sqrt{2}} (H_{ij} - \frac{1}{2} h_{ij} H) \left( 1 - \frac{\beta_\perp}{\alpha} \right) - \frac{1}{\sqrt{2} \alpha} \psi^4 \left\{ \tilde{D}_{(i} \beta_{\parallel j)} - \frac{1}{2} \tilde{h}_{ij} \tilde{D}_k \beta^k_{\parallel} - \frac{1}{2} [\tilde{h}_{ik} \tilde{h}_{j\ell} \tilde{u}^{k\ell} - \frac{1}{2} \tilde{h}_{ij} \tilde{h}_{k\ell} \tilde{u}^{k\ell}] \right\} \]

\[ \tilde{s}^k \tilde{\nabla}_k \ln \psi = -\frac{1}{4} (\tilde{h}^{ij} \tilde{\nabla}_i \tilde{s}_j - \psi^2 J) \]

\[ \beta^i = \alpha \psi^{-2} \tilde{s}^i + \beta^i_{\parallel} \]

\[ 0 = \tilde{D}_{(i} \beta_{\parallel j)} - \frac{1}{2} \tilde{h}_{ij} \tilde{D}_k \beta^k_{\parallel} \]
AH/Quasiequilibrium Boundary Conditions

\[ \theta = \frac{\psi^{-2}}{\sqrt{2}} \left[ \tilde{h}^{ij} \tilde{\nabla}_i \tilde{s}_j + 4 \tilde{s}^k \tilde{\nabla}_k \ln \psi - \psi^2 J \right] \]

\[ \sigma_{ij} = \frac{1}{\sqrt{2}} (H_{ij} - \frac{1}{2} h_{ij} H) \left( 1 - \frac{\beta_{\parallel}}{\alpha} \right) \]

\[ - \frac{1}{\sqrt{2}} \frac{\psi^4}{\alpha} \left\{ \tilde{D}_{(i\beta_{\parallel})} - \frac{1}{2} \tilde{h}_{ij} \tilde{D}_k \beta_{\parallel}^k - \frac{1}{2} \left[ \tilde{h}_{ik} \tilde{h}_{j\ell} \tilde{u}^{k\ell} - \frac{1}{2} \tilde{h}_{ij} \tilde{h}_{k\ell} \tilde{u}^{k\ell} \right] \right\} \]

\[ \tilde{s}^k \tilde{\nabla}_k \ln \psi = -\frac{1}{4} (\tilde{h}^{ij} \tilde{\nabla}_i \tilde{s}_j - \psi^2 J) \]

\[ \beta^i = \alpha \psi^{-2} \tilde{s}^i + \beta_{\parallel}^i \]

\[ 0 = \tilde{D}_{(i\beta_{\parallel})} - \frac{1}{2} \tilde{h}_{ij} \tilde{D}_k \beta_{\parallel}^k \]

The boundary condition on the lapse is not fixed by QE assumptions. It has been shown to be associated with the initial temporal gauge choice and is taken to be freely specifiable.
Defining the Spin of the Black Hole

The spin parameters $\beta^i$ can be defined by demanding that the time vector associated with quasiequilibrium in the corotating frame must be null, forming the null generators of the horizon.

$$k^{\mu} \propto (n^{\mu} + s^{\mu}) \implies k^{\mu} = [1, \alpha s^i - \beta^i]$$

This vector $k^{\mu}$ is null for any choice of $\alpha$ & $\beta^i$.

In the frame where a black hole is not spinning, the null time vector has components $t^{\mu} = [1, \vec{0}]$.

---

**Corotating Holes**

Corotating holes are at rest in the corotating frame, where we must pose boundary conditions. So,

$$k^{\mu} = [1, \alpha s^i - \beta^i] = [1, \vec{0}]$$

Thus we find

$$\beta^i = \alpha s^i \implies \beta^i = 0$$

---

**Irrotational Holes**

Irrotational holes are at rest in the inertial frame. With the time vectors in the inertial and corotating frames related by

$$\frac{\partial}{\partial t} = \frac{\partial}{\partial \tilde{t}} + \Omega_0 \frac{\partial}{\partial \phi}$$

$$k^{\mu} = [1, \alpha s^i - \beta^i] = [1, -\Omega_0 (\partial/\partial \phi)^i]$$

Thus we find

$$\beta^i = \alpha s^i + \Omega_0 \left( \frac{\partial}{\partial \phi} \right)^i \implies \beta^i = \Omega_0 \xi^i$$

$$\xi^i \approx \left( \frac{\partial}{\partial \phi} \right)^i \& \tilde{D} (\xi_j) - \frac{1}{2} \tilde{h}_{ij} \tilde{D}_k \xi^k = 0$$
The Lapse BC & QE

So far, nothing has fixed a boundary condition on the lapse $\alpha$. One possibility[8] is to recall that $\theta \dot{\theta}$ is a Lorentz invariant and so to consider $L_\zeta \dot{\theta} = 0$ as a quasiequilibrium condition.

$$L_\zeta \dot{\theta} = 0 \quad \Rightarrow \quad J \tilde{s}^i \tilde{\nabla}_i \alpha = -\psi^2 (J^2 - JK + \tilde{D}) \alpha$$

$$\tilde{D} \equiv \psi^{-4} [\tilde{h}^{ij}(\tilde{D}_i - J_i)(\tilde{D}_j - J_j) - \frac{1}{2} \tilde{R} + 2 \tilde{D}^2 \ln \psi]$$
The Lapse BC & QE

So far, nothing has fixed a boundary condition on the lapse $\alpha$. One possibility[8] is to recall that $\theta\dot{\theta}$ is a Lorentz invariant and so to consider $\mathcal{L}_\zeta \dot{\theta} = 0$ as a quasiequilibrium condition.

$$\mathcal{L}_\zeta \dot{\theta} = 0 \quad \Rightarrow \quad J \tilde{s}^i \tilde{\nabla}_i \alpha = -\psi^2 (J^2 - JK + \tilde{D}) \alpha$$

$$\tilde{D} \equiv \psi^{-4}[\tilde{h}^{ij}(\tilde{D}_i - J_i)(\tilde{D}_j - J_j) - \frac{1}{2} \tilde{R} + 2 \tilde{D}^2 \ln \psi]$$

This conditions is satisfied for stationary solutions, but seems to be degenerate with the other QE boundary conditions. To see this, note that the stationary maximal slicings of Schwarzschild form a 1-parameter family:

$$ds^2 = \frac{dR^2}{1 - \frac{2M}{R} + \frac{C^2}{R^4}} + R^2 d^2 \Omega$$

$$\alpha = \sqrt{1 - \frac{2M}{R} + \frac{C^2}{R^4}}$$

$$\beta^R = \frac{C}{R^2} \sqrt{1 - \frac{2M}{R} + \frac{C^2}{R^4}}$$

$$K^i_j = \frac{C}{R^3} \begin{bmatrix} -2 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\alpha|_S = \frac{C}{4M^2}$$
For a given choice of the Lapse BC, $\tilde{\gamma}_{ij}$ and $K$, we are still left with a family of solutions parameterized by the orbital angular velocity $\Omega_0$.

Except for the case of a single spinning black hole, it is not reasonable to expect more than one value of $\Omega_0$ to correspond to a system in quasiequilibrium.

GGB[9, 10] have suggested a way to pick the quasiequilibrium value of $\Omega_0$:

$\Omega_0$ is chosen as the value for which the ADM energy $E_{\text{ADM}}$ equals the Komar mass $M_K$.

\[
M_K = \frac{1}{4\pi} \int_{\infty} \tilde{\gamma}^{ij}(\tilde{\nabla}_i \alpha - \beta^k K_{ik})d^2S_j \quad \text{Acceptable definition of the mass only for stationary spacetimes.}
\]

\[
E_{\text{ADM}} = \frac{1}{16\pi} \int_{\infty} \gamma^{ij} \tilde{\nabla}_k (G^k_i - \delta^k_i G)d^2S_j \quad \text{Acceptable definition of the mass for arbitrary spacetimes.}
\]

$G_{ij} \equiv \gamma_{ij} - f_{ij}$
Summary of QE Formalism

\[ \gamma_{ij} = \psi^4 \tilde{\gamma}_{ij} \quad K^{ij} = \psi^{-10} \tilde{A}^{ij} + \frac{1}{3} \gamma^{ij} K \quad \tilde{A}^{ij} = \frac{\psi^6}{2\alpha} (\tilde{\mathcal{L}} \beta)^{ij} \quad \partial_t \tilde{\gamma}_{ij} = 0 \]

\[ \tilde{\nabla}^2 \psi - \frac{1}{8} \psi \tilde{R} - \frac{1}{12} \psi^5 K^2 + \frac{1}{8} \psi^{-7} \tilde{A}_{ij} \tilde{A}^{ij} = 0 \]

\[ \tilde{\nabla}_j (\tilde{\mathcal{L}} \beta)^{ij} - (\tilde{\mathcal{L}} \beta)^{ij} \tilde{\nabla}_j \ln \alpha \psi^{-6} = \frac{4}{3} \alpha \tilde{\nabla}^i K \]

\[ \tilde{\nabla}^2 (\alpha \psi) - (\alpha \psi) \left[ \frac{1}{8} \tilde{R} + \frac{5}{12} \psi^4 K^2 + \frac{7}{8} \psi^{-8} A_{ij} A^{ij} \right] = \psi^5 \beta^i \tilde{\nabla}_i K \quad \partial_t K = 0 \]

\[ \tilde{s}^k \tilde{\nabla}_k \ln \psi \big|_S = -\frac{1}{4} (\tilde{h}^{ij} \tilde{\nabla}_i \tilde{s}_j - \psi^2 J) \big|_S \quad \theta = 0 \]

\[ \beta^i \big|_S = \begin{cases} \alpha \psi^{-2} \tilde{s}^i \big|_S & \text{corotation} \\ \alpha \psi^{-2} \tilde{s}^i \big|_S + \Omega_0 \xi^i \big|_S & \text{irrotation} \end{cases} \]

\[ \alpha \big|_S = \text{unspecified by QE} \]

The only remaining freedom in the system is the choice of the lapse boundary condition, the initial spatial and temporal gauge, and the initial dynamical ("wave") content found in \( \alpha \big|_S, \tilde{\gamma}_{ij} \) and \( K \).
Corotating; Maximal Slice; Comparison; $E_b/\mu$ vs $J/\mu m$

\[ CO: \text{MS} - \frac{d(\alpha \psi)}{dr} = \frac{(\alpha \psi)}{2r} \]

\[ CO: \text{HKV} - \text{GGB} \]

\[ CO: \text{EOB} - 3\text{PN} \]

\[ CO: \text{EOB} - 2\text{PN} \]

\[ CO: \text{EOB} - 1\text{PN} \]
Irrotational; Maximal Slice; Comparison; $\frac{E_b}{\mu}$ vs $\frac{J}{\mu m}$
True Irrotation; Maximal Slice; Comparison; $E_b/\mu$ vs $J/\mu m$
Maximal Slice; Comparison of ISCO; $\frac{E_b}{M_{\text{irr}}}$ vs $\Omega M_{\text{irr}}$
Maximal Slice; Comparison of ISCO; $E_b/M_{\text{irr}}$ vs $J/M_{\text{irr}}^2$
Maximal Slice; Comparison of ISCO; $J/M_{irr}^2$ vs $\Omega M_{irr}$
Measuring the Spin of a Black Hole

• Spin is only rigorously defined at spatial/null infinity.

• Must use quasi-local definition: e.g. Brown & York\cite{4} or Ashtekar & Krishnan\cite{1}

\[
S = -\frac{1}{8\pi} \oint_{BH} K_{ij} \xi^i s^j \sqrt{h} d^2 x
\]

\[
= -\frac{1}{8\pi} \oint_{BH} \tilde{A}_{ij} \xi^i \tilde{s}^j \sqrt{\tilde{h}} d^2 x
\]

\[\xi^i = \begin{cases} 
\xi_{CK}^i &: \text{Killing vector of } \tilde{h}_{ij} \Rightarrow \text{conformal Killing vector of } h_{ij} \\
\xi_{KV}^i &: \text{Killing vector of } h_{ij}
\end{cases}\]
Corotation: Flat & True KV Spin; $S/M_{irr}^2$ vs $m\Omega_0$
Corotation: Flat & True KV Spin Error; \( \frac{(S - S_{Kerr})}{S_{Kerr}} \) vs \( m\Omega_0 \)
Irrotation: Flat & True KV Spin; $S/M^2_{irr}$ vs $m\Omega_0$
Irrotation: Flat & True KV Spin Error; \( \frac{S}{S_{Kerr}} \) vs \( m\Omega_0 \)
True Irrotation: Flat & True KV Spin; $S/M^2_{irr}$ vs $m\Omega_0$
True Irrotation: Flat & True KV Spin Error; \( \frac{S}{S_{Kerr}} \) vs \( m\Omega_0 \)
Are We Finding Quasicircular orbits?

- The Komar mass criteria is used to choose the quasiequilibrium model which implies quasicircular orbits.

- Can we find an independent way of verifying this?
  - Comparison with post-Newtonian:
    1. Compare plots as we have done already.
  - An effective potential approach[5, 7].
Corotation: Effective Potential; $E_b/\mu$ vs $l/m$
Irrotation: Effective Potential; \( E_b/\mu \) vs \( \ell/m \)
True Irrotation: Effective Potential; $E_b/\mu$ vs $l/m$
