## Solution Set 11

First we need the character table for $O_{h}$, which is easily determined from the character table for $O$ and that for the inversion group $J$. They are in the table below.

| $\boldsymbol{J}$ | $\mathbf{E}$ | $\mathbf{J}$ |
| :---: | :---: | :---: |
| $\Gamma^{+}$ | 1 | 1 |
| $\Gamma^{-}$ | 1 | -1 |

Next we need
to work out the characters for the $l=$ 6 representation of the rotation group. We will assume that under parity, we are working with a system where the wave function goes like $(-1)^{l}=+1$, so that makes that part of the problem easy. The character of $E$ is the

| $\mathcal{O}_{\mathbf{h}}$ | $\mathbf{E}$ | $\mathbf{8 C}_{\mathbf{3}}$ | $\mathbf{3 C}_{\mathbf{4}}{ }^{\mathbf{}}$ | $\mathbf{6} \mathbf{C}_{\mathbf{2}}$ | $\mathbf{6} \mathbf{C}_{\mathbf{4}}$ | $\mathbf{J}$ | $\mathbf{8 S}_{\mathbf{6}}$ | $\mathbf{3 \sigma}$ | $\mathbf{6}_{\mathbf{d}}$ | $\mathbf{6 S}_{\mathbf{4}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ${\boldsymbol{\boldsymbol { A } _ { \mathbf { 1 } } { } ^ { + }}}^{1}$ | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |  |
| $\boldsymbol{A}_{\mathbf{2}}{ }^{+}$ | 1 | 1 | 1 | -1 | -1 | 1 | 1 | 1 | -1 | -1 |
| $\boldsymbol{E}^{+}$ | 2 | -1 | 2 | 0 | 0 | 2 | -1 | 2 | 0 | 0 |
| $\boldsymbol{T}_{\mathbf{1}}{ }^{+}$ | 3 | 0 | -1 | -1 | 1 | 3 | 0 | -1 | -1 | 1 |
| $\boldsymbol{T}_{\mathbf{2}}{ }^{+}$ | 3 | 0 | -1 | 1 | -1 | 3 | 0 | -1 | 1 | -1 |
| $\boldsymbol{A}_{\mathbf{1}}^{-}$ | 1 | 1 | 1 | 1 | 1 | -1 | -1 | -1 | -1 | -1 |
| $\boldsymbol{A}_{\mathbf{2}}^{-}$ | 1 | 1 | 1 | -1 | -1 | -1 | -1 | -1 | 1 | 1 |
| $\boldsymbol{E}^{-}$ | 2 | -1 | 2 | 0 | 0 | -2 | 1 | -2 | 0 | 0 |
| $\boldsymbol{T}_{\mathbf{1}}^{-}$ | 3 | 0 | -1 | -1 | 1 | -3 | 0 | 1 | 1 | -1 |
| $\boldsymbol{T}_{\mathbf{2}}^{-}$ | 3 | 0 | -1 | 1 | -1 | -3 | 0 | 1 | -1 | 1 |
| $\Gamma_{\mathbf{6}}$ | 13 | 1 | 1 | 1 | -1 | 13 | 1 | 1 | 1 | -1 | dimensionality of the representation, which is 13 . For the others, we use the formula

$$
\chi(\alpha)=\frac{\sin \left[\left(l+\frac{1}{2}\right) \alpha\right]}{\sin \left[\frac{1}{2} \alpha\right]}
$$

The results are included in the table, and then just copied for the improper rotations. Noting that the second half always matches the first, we need only look at the + representations, which means we can focus just on $O$, the first twenty-four elements. Using orthogonality, it's easy to see that the number of copies of $A_{1}$ and $A_{2}$ is $(13 * 1+8+3+6-6) / 24=1$. The number of copies of $T_{1}$ is $(13 * 3-3-6-6) / 24=1$, and of $T_{2}$ is $(13 * 3-3+6+6) / 24=2$. Finally, there is $(13 * 2-8+3 * 2) / 24=1$ copy of $E$. So in summary,

$$
\Gamma_{6}=A_{1}^{+} \oplus A_{2}^{+} \oplus E^{+} \oplus T_{1}^{+} \oplus 2 T_{2}^{+}
$$
