Notes on Lecture 35: Chap. 11 in F&W

Heat conduction

- 1. Basic equations**
- 2. Boundary value problems**

11/17/2021

PHY 711 Fall 2021 – Lecture 35

1

In today's lecture we will take a quick look at heat transfer following Chapter 11 of your textbook.

33	Fri, 11/12/2021	Chap. 10	Surface waves in fluids	
34	Mon, 11/15/2021	Chap. 10	Surface waves in fluids; soliton solutions	
35	Wed, 11/17/2021	Chap. 11	Heat conduction	
36	Fri, 11/19/2021	Chap. 12	Viscous effects on hydrodynamics	
	Mon, 11/22/2021		Presentations	
	Wed, 11/24/2021		Thanksgiving	
	Fri, 11/26/2021		Thanksgiving	
37	Mon, 11/29/2021	Chap. 13	Elasticity	
38	Wed, 12/01/2021	Chap. 1-13	Review	
39	Fri, 12/03/2021	Chap. 1-13	Review	

Schedule.

Schedule for Monday, November 22, 2021

Time	Name	Topic
10:00-10:20	Owen	
10:20-10:40	Manikata	
10:40-11:00	Wells	
11:00-11:20	Can	
11:20-11:40	Ramesh	

Fill in topic!

PHYSICS COLLOQUIUM

4 PM Olin 101 & zoom

THURSDAY

•
NOVEMBER 18, 2021

“Breaking Ultrathin Ionic Wires in LNNano”

This talk is divided into two parts.

In the first part, I'll briefly describe the Brazilian Nanotechnology National Laboratory (LNNano), an open facility for research and innovation in the field of nanoscience and nanotechnology located in Campinas, Brazil, in the same campus as 3 other National Laboratories which include Sirius, a 4th generation synchrotron facility.

In the second part, I'll discuss our recent joint theory/experiment work on the formation and rupture of monatomic ZrO₂ wires.

Rodrigo B. Capaz, Ph.D.

Director, Brazilian Nanotechnology
National Laboratory (LNNano)
Brazilian Center for Research in Energy
and Materials (CNPem)
Campinas, Brazil

Full Professor, Physics Institute
Federal University of Rio de Janeiro
Rio de Janeiro, Brazil

11/17/2021

FRI / 11 Fall 2021 - Lecture 33

4

Conduction of heat

Enthalpy of a system at constant pressure p
non uniform temperature $T(\mathbf{r}, t)$
mass density ρ and heat capacity c_p

$$H = \int_V \rho c_p (T(\mathbf{r}, t) - T_0) d^3r + H_0(T_0, p)$$

11/17/2021

PHY 711 Fall 2021 – Lecture 35

5

Enthalpy as a measure of heat of a system at constant pressure in terms of the heat capacity of the material.

Note that in this treatment we are considering a system at constant pressure p

Notation: Heat added to system $-- dQ = TdS$
 External work done on system $-- dW = -pdV$
 Internal energy $-- dE = dQ + dW = TdS - pdV$
 Entropy $-- dS$
 Enthalpy $-- dH = d(E + pV) = TdS + Vdp$
 Heat capacity at constant pressure:

$$C_p \equiv \left(\frac{dQ}{dT} \right)_p = \left(\frac{\partial H}{\partial T} \right)_p = T \left(\frac{\partial S}{\partial T} \right)_p$$

$$C_p = \int \rho c_p d^3r$$

More generally, note that c_p can depend on T ; we are assuming that dependence to be trivial.

11/17/2021

PHY 711 Fall 2021 -- Lecture 35

6

Some notations and concepts from thermodynamics.

Conduction of heat -- continued

$$H = \int_V \rho c_p (T(\mathbf{r}, t) - T_0) d^3r + H_0(T_0, p)$$

Time rate of change of enthalpy:

$$\frac{dH}{dt} = \int_V \rho c_p \frac{\partial T(\mathbf{r}, t)}{\partial t} d^3r = - \int_A \mathbf{j}_h \cdot d\mathbf{A} + \int_V \rho \dot{q} d^3r$$

heat flux

heat source

$$\rho c_p \frac{\partial T(\mathbf{r}, t)}{\partial t} = -\nabla \cdot \mathbf{j}_h + \rho \dot{q}$$

11/17/2021

PHY 711 Fall 2021 -- Lecture 35

7

Now consider how the enthalpy of a system may change in time. The temperature may change, there may be heat flux, and there may be a source or sink for heat flow.

Conduction of heat -- continued

$$\rho c_p \frac{\partial T(\mathbf{r}, t)}{\partial t} = -\nabla \cdot \mathbf{j}_h + \rho \dot{q}$$

Empirically: $\mathbf{j}_h = -k_{th} \nabla T(\mathbf{r}, t)$

$$\Rightarrow \frac{\partial T(\mathbf{r}, t)}{\partial t} = \kappa \nabla^2 T(\mathbf{r}, t) + \frac{\dot{q}}{c_p}$$

$$\kappa \equiv \frac{k_{th}}{\rho c_p} \quad \text{thermal diffusivity}$$

https://www.engineersedge.com/heat_transfer/thermal_diffusivity_table_13953.htm

Typical values (m²/s)

Air	2x10 ⁻⁵
Water	1x10 ⁻⁷
Copper	1x10 ⁻⁴

11/17/2021

PHY 711 Fall 2021 -- Lecture 35

8

In order to relate these quantities, we need to know how enthalpy is related to temperature and we will use the empirical relations based on observation that heat flux is proportional to the gradient of temperature. The Thermal diffusivity coefficient is highly dependent on the material as seen in this short list taken from the internet.

Boundary value problems for heat conduction

$$\frac{\partial T(\mathbf{r}, t)}{\partial t} - \kappa \nabla^2 T(\mathbf{r}, t) = \frac{\dot{q}}{c_p}$$

Without source term:
$$\frac{\partial T(\mathbf{r}, t)}{\partial t} - \kappa \nabla^2 T(\mathbf{r}, t) = 0$$

Example with boundary values: $T(0, y, z, t) = T(a, y, z, t) = T_0$

11/17/2021

PHY 711 Fall 2021 – Lecture 35

9

Example boundary value problem which we will solve in the case that the source term is zero.

Have you ever encountered the following equation in other contexts and if so where?

$$\frac{\partial T(\mathbf{r}, t)}{\partial t} - \kappa \nabla^2 T(\mathbf{r}, t) = 0$$

Boundary value problems for heat conduction

$$\frac{\partial T(\mathbf{r}, t)}{\partial t} - \kappa \nabla^2 T(\mathbf{r}, t) = 0$$

$$T(0, y, z, t) = T(a, y, z, t) = T_0$$

$$\frac{\partial T(x, 0, z, t)}{\partial y} = \frac{\partial T(x, b, z, t)}{\partial y} = 0$$

$$\frac{\partial T(x, y, 0, t)}{\partial z} = \frac{\partial T(x, y, c, t)}{\partial z} = 0$$

Assuming thermally insulated boundaries

Separation of variables : $T(x, y, z, t) = T_0 + X(x)Y(y)Z(z)e^{-\lambda t}$

Let $\frac{d^2 X}{dx^2} = -\alpha^2 X$ $\frac{d^2 Y}{dy^2} = -\beta^2 Y$ $\frac{d^2 Z}{dz^2} = -\gamma^2 Z$

$$\Rightarrow -\lambda + \kappa(\alpha^2 + \beta^2 + \gamma^2) = 0$$

Using separation of variables to solve the problem.

Boundary value problems for heat conduction

$$T(x, y, z, t) = T_0 + X(x)Y(y)Z(z)e^{-\lambda t}$$

$$X(0) = X(a) = 0 \quad \Rightarrow \quad X(x) = \sin\left(\frac{m\pi x}{a}\right)$$

$$\frac{dY(0)}{dy} = \frac{dY(b)}{dy} = 0 \quad \Rightarrow \quad Y(y) = \cos\left(\frac{n\pi y}{b}\right)$$

$$\frac{dZ(0)}{dz} = \frac{dZ(c)}{dz} = 0 \quad \Rightarrow \quad Z(z) = \cos\left(\frac{p\pi z}{c}\right)$$

$$-\lambda_{nmp} + \kappa \left(\left(\frac{n\pi}{a}\right)^2 + \left(\frac{m\pi}{b}\right)^2 + \left(\frac{p\pi}{c}\right)^2 \right) = 0$$

11/17/2021

PHY 711 Fall 2021 – Lecture 35

12

Some details for this case.

Boundary value problems for heat conduction

Full solution:

$$T(x, y, z, t) = T_0 + \sum_{nmp} C_{nmp} \sin\left(\frac{m\pi x}{a}\right) \cos\left(\frac{n\pi y}{b}\right) \cos\left(\frac{p\pi z}{c}\right) e^{-\lambda_{nmp} t}$$

$$\lambda_{nmp} = \kappa \left(\left(\frac{n\pi}{a}\right)^2 + \left(\frac{m\pi}{b}\right)^2 + \left(\frac{p\pi}{c}\right)^2 \right)$$

More details.

Full solution:

$$T(x, y, z, t) = T_0 + \sum_{nmp} C_{nmp} \sin\left(\frac{m\pi x}{a}\right) \cos\left(\frac{n\pi y}{b}\right) \cos\left(\frac{p\pi z}{c}\right) e^{-\lambda_{nmp} t}$$

At $t=0, z=0$

Full solution:

$t=0.$

$$T(x, y, z, t) = T_0 + \sum_{nmp} C_{nmp} \sin\left(\frac{m\pi x}{a}\right) \cos\left(\frac{n\pi y}{b}\right) \cos\left(\frac{p\pi z}{c}\right) e^{-\lambda_{nmp}t}$$

Time evolution

$nmp=100$

at $z=0$

11/17/2021

PHY 711 Fall 2021 -- Lecture 35

15

Visualization of the time evolution.

What real system could have such a temperature distribution?

Comment – While one can imagine that the boundary conditions can be readily realized, the single normal mode patterns are much harder. On the other hand, we see that the lowest values of λ have the longest time constants.

Oscillatory thermal behavior

Here we assume that the spatial variation is along z

$$T(z=0, t) = \Re(T_0 e^{-i\omega t})$$

$$\frac{\partial T}{\partial t} = \kappa \frac{\partial^2 T}{\partial z^2}$$

Assume: $T(z, t) = \Re(f(z)e^{-i\omega t})$

$$(-i\omega)f = \kappa \frac{d^2 f}{dz^2}$$

Let $f(z) = Ae^{\alpha z}$

$$\alpha^2 = -\frac{i\omega}{\kappa} = e^{3i\pi/2} \frac{\omega}{\kappa}$$

$$\alpha = \pm(1-i)\sqrt{\frac{\omega}{2\kappa}}$$

11/17/2021

PHY 711 Fall 2021 – Lecture 35

17

Now consider an oscillatory solutions.

Oscillatory thermal behavior -- continued

$$T(z=0, t) = \Re(T_0 e^{-i\omega t})$$

$$T(z, t) = \Re\left(A e^{\pm(1-i)z/\delta} e^{-i\omega t}\right)$$

$$\text{where } \delta \equiv \sqrt{\frac{2\kappa}{\omega}}$$

$$\text{Physical solution: } T(z, t) = T_0 e^{-z/\delta} \cos\left(\frac{z}{\delta} - \omega t\right)$$

11/17/2021

PHY 711 Fall 2021 -- Lecture 35

18

Analysis of solution.

$$T(z,t) = T_0 e^{-z/\delta} \cos\left(\frac{z}{\delta} - \omega t\right)$$

$t = 0.$

11/17/2021

PHY 711 Fall 2021 -- Lecture 35

19

Animation of solution.

Does this expression say the temperature transmits along the z axis?

Comment – In this case, our setup approximates trivial variation in the x - y plane so that all variation is along z . The spatial form along z with oscillating boundary condition at $z=0$ is a result of the form of the heat equation.

Initial value problem in an infinite domain; Fourier transform

$$\frac{\partial T(\mathbf{r}, t)}{\partial t} - \kappa \nabla^2 T(\mathbf{r}, t) = 0$$

$$T(\mathbf{r}, 0) = f(\mathbf{r})$$

$$\text{Let : } \tilde{T}(\mathbf{q}, t) = \int d^3r e^{-i\mathbf{q}\cdot\mathbf{r}} T(\mathbf{r}, t)$$

$$\tilde{f}(\mathbf{q}) = \int d^3r e^{-i\mathbf{q}\cdot\mathbf{r}} f(\mathbf{r})$$

$$\Rightarrow \tilde{T}(\mathbf{q}, 0) = \tilde{f}(\mathbf{q})$$

$$\Rightarrow \frac{\partial \tilde{T}(\mathbf{q}, t)}{\partial t} = -\kappa q^2 \tilde{T}(\mathbf{q}, t)$$

$$\tilde{T}(\mathbf{q}, t) = \tilde{T}(\mathbf{q}, 0) e^{-\kappa q^2 t}$$

Now consider an initial value problem.

Initial value problem in an infinite domain; Fourier transform

$$\tilde{T}(\mathbf{q}, t) = \int d^3 r e^{-i\mathbf{q} \cdot \mathbf{r}} T(\mathbf{r}, t) \quad \Rightarrow \quad T(\mathbf{r}, t) = \frac{1}{(2\pi)^3} \int d^3 q e^{i\mathbf{q} \cdot \mathbf{r}} \tilde{T}(\mathbf{q}, t)$$

$$\tilde{T}(\mathbf{q}, t) = \tilde{T}(\mathbf{q}, 0) e^{-\kappa q^2 t}$$

$$T(\mathbf{r}, t) = \frac{1}{(2\pi)^3} \int d^3 q e^{i\mathbf{q} \cdot \mathbf{r}} \tilde{T}(\mathbf{q}, 0) e^{-\kappa q^2 t}$$

$$\tilde{T}(\mathbf{q}, 0) = \tilde{f}(\mathbf{q}) = \int d^3 r e^{-i\mathbf{q} \cdot \mathbf{r}} f(\mathbf{r})$$

$$T(\mathbf{r}, t) = \int d^3 r' G(\mathbf{r} - \mathbf{r}', t) T(\mathbf{r}', 0)$$

$$\text{with } G(\mathbf{r} - \mathbf{r}', t) \equiv \frac{1}{(2\pi)^3} \int d^3 q e^{i\mathbf{q} \cdot (\mathbf{r} - \mathbf{r}')} e^{-\kappa q^2 t}$$

11/17/2021

PHY 711 Fall 2021 – Lecture 35

22

Using Green's functions to analyze the results.

Initial value problem in an infinite domain; Fourier transform

$$T(\mathbf{r}, t) = \int d^3 r' G(\mathbf{r} - \mathbf{r}', t) T(\mathbf{r}', 0)$$

$$\text{with } G(\mathbf{r} - \mathbf{r}', t) \equiv \frac{1}{(2\pi)^3} \int d^3 q e^{i\mathbf{q} \cdot (\mathbf{r} - \mathbf{r}')} e^{-\kappa q^2 t}$$

$$G(\mathbf{r} - \mathbf{r}', t) = \frac{1}{(4\pi\kappa t)^{3/2}} e^{-|\mathbf{r} - \mathbf{r}'|^2 / (4\kappa t)}$$

Some details.

Heat equation in half-space

$$\frac{\partial T(\mathbf{r}, t)}{\partial t} - \kappa \nabla^2 T(\mathbf{r}, t) = 0$$

$T(\mathbf{r}, t) \Rightarrow T(z, t)$ with initial and boundary values :

$$T(z, t) \equiv 0 \quad \text{for } z < 0$$

$$T(z, 0) = 0 \quad \text{for } z > 0$$

$$T(0, t) = T_0 \quad \text{for } t \geq 0$$

$$\text{Solution : } T = T_0 \operatorname{erfc}\left(\frac{z}{2\sqrt{\kappa t}}\right)$$

$$\text{where } \operatorname{erfc}(x) \equiv \frac{2}{\sqrt{\pi}} \int_x^\infty e^{-u^2} du$$

For half space boundary.

More details about the error function --

<https://dlmf.nist.gov/7>

§7.2(i) Error Functions

$$7.2.1 \quad \operatorname{erf} z = \frac{2}{\sqrt{\pi}} \int_0^z e^{-t^2} dt,$$

$$7.2.2 \quad \operatorname{erfc} z = \frac{2}{\sqrt{\pi}} \int_z^\infty e^{-t^2} dt = 1 - \operatorname{erf} z,$$

Figure 7.3.1: Complementary error functions $\operatorname{erfc} x$ and $\operatorname{erfc}(10x)$, $-3 \leq x \leq 3$. ©

Heat equation in half-space -- continued

$$\frac{\partial T(z,t)}{\partial t} - \kappa \frac{\partial^2 T(z,t)}{\partial z^2} = 0$$

Solution : $T = T_0 \operatorname{erfc}\left(\frac{z}{2\sqrt{\kappa t}}\right)$

where $\operatorname{erfc}(x) \equiv \frac{2}{\sqrt{\pi}} \int_x^\infty e^{-u^2} du$

Note that $\frac{d \operatorname{erfc}(x)}{dx} = \frac{d}{dx} \frac{2}{\sqrt{\pi}} \int_x^\infty e^{-u^2} du = -\frac{2}{\sqrt{\pi}} e^{-x^2}$

$$\frac{\partial}{\partial t} \operatorname{erfc}\left(\frac{z}{2\sqrt{\kappa t}}\right) = \frac{2}{\sqrt{\pi}} e^{-(z^2/(4\kappa t))} \left(\frac{z}{4\sqrt{\kappa t^3}}\right)$$

$$\frac{\partial^2}{\partial z^2} \operatorname{erfc}\left(\frac{z}{2\sqrt{\kappa t}}\right) = \frac{2}{\sqrt{\pi}} e^{-(z^2/(4\kappa t))} \left(\frac{z}{4\kappa\sqrt{\kappa t^3}}\right)$$

11/17/2021

PHY 711 Fall 2021 -- Lecture 35

26

Some details.

Plots of solution at various times.

Animation.
