

PHY 341/641
Thermodynamics and Statistical Physics

Lecture 3

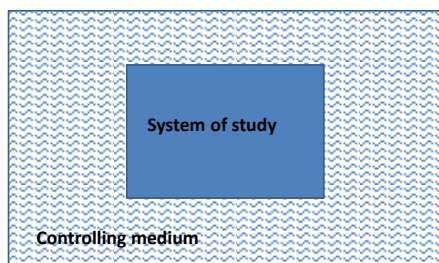

1. Introduction to thermodynamics (Chapter 2)
 - a. Definition of "the system"
 - b. Thermodynamic variables (T, P, V, N, ...)
2. First law of thermodynamics -- the sign of work
 - a. Some examples for ideal gas systems
 - b. Some cyclic processes
 - c. Efficiency of process

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

1

Macroscopic viewpoint -- thermodynamics
 (start reading Chapter 2)

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

2

Thermodynamic process -- WORK

various sign conventions !!!#\$!!!

Sign convention in your text -- work ON the system;
 system expands $\Rightarrow W < 0$:

$$dW = -Fdx = -PA dx = -PdV$$

$$W_{1 \rightarrow 2} = - \int_{V_1}^{V_2} P(T, V) dV$$

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

3

Work sign conventions in various text books:

$$dW = \pm PdV$$

\nearrow Work done BY the system
 \searrow Work done ON the system

4

First law of thermodynamics

$$U_2 - U_1 \equiv \Delta U = Q + W$$

$Q \equiv$ heat added TO the system

$W \equiv$ work done ON the system

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

5

First law : $dU = dQ + dW$

$$dW = -PdV$$

Examples of heat and work performed by ideal gas

$$PV = NkT \quad (k \equiv k_B \text{ Boltzmann constant})$$

$$U = \frac{k}{\gamma - 1} NT = \frac{PV}{\gamma - 1} \quad (\gamma = C_p / C_v)$$

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

6

Various ideal gas processes (assuming N constant)

Process	Variables	Q	W	ΔU
Constant V	$V_1, P_1, T_1 \rightarrow V_2, P_2, T_2$	$\frac{(P_2 - P_1)N_f}{\gamma - 1}$	0	$\frac{(P_2 - P_1)N_f}{\gamma - 1}$
Constant P	$V_1, P_1, T_1 \rightarrow V_2, P_1, T_2$	$\frac{P_1(V_2 - V_1)}{\gamma - 1}$	$-P_1(V_2 - V_1)$	$\frac{P_1(V_2 - V_1)}{\gamma - 1}$
Constant T	$V_1, P_1, T_1 \rightarrow V_2, P_2, T_1$	$P_1V_1 \ln\left(\frac{V_2}{V_1}\right)$	$-P_1V_1 \ln\left(\frac{V_2}{V_1}\right)$	0
Q = 0	$V_1, P_1, T_1 \rightarrow V_2, P_2, T_2$	0	$-\frac{P_1V_1}{\gamma - 1} \left(1 - \left(\frac{V_1}{V_2}\right)^{\gamma-1}\right) - \frac{P_2V_2}{\gamma - 1} \left(1 - \left(\frac{V_2}{V_1}\right)^{\gamma-1}\right)$	

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

7

Some details of the adiabatic case: $Q = 0$

$$dU = dW$$

$$\frac{d(PV)}{\gamma - 1} = -PdV$$

$$PdV \left(\frac{1}{\gamma - 1} + 1 \right) + VdP \left(\frac{1}{\gamma - 1} \right) = 0$$

$$\frac{dV}{V} \gamma + \frac{dP}{P} = 0 \quad \Rightarrow \quad PV^\gamma = P_1V_1^\gamma$$

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

8

Ideal gas expansions

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

9

Work performed during a cyclic process:

$$W_{net} = -(P_{high} - P_{low})(V_{high} - V_{low})$$

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

10

Efficiency of cyclic processes:

The notions of work and heat can be used for practical devices

Example: Internal combustion engine

Otto cycle:

<http://www.howstuffworks.com/engine1.htm>

General measure of process efficiency (assuming no frictional losses;

"completely reversible processes"):

$$\varepsilon = \frac{\text{output}}{\text{input}} = \frac{\text{work done by system}}{\text{heat input to system}} = \frac{-W_{total}}{Q_{input}}$$

1/23/2012

PHY 341/641 Spring 2012 -- Lecture 3

11

$$\varepsilon = \frac{-W_{total}}{Q_{input}}$$

$$W_{total} = -(P_{high} - P_{low})(V_{high} - V_{low})$$

$$Q_{input} = Q_{12} + Q_{41}$$

$$\varepsilon = \frac{(P_{high} - P_{low})(V_{high} - V_{low})}{\frac{\gamma}{\gamma-1}(P_{high}(V_{high} - V_{low})) + \frac{1}{\gamma-1}(V_{low}(P_{high} - P_{low}))}$$

1/23/2012
