# Important dates: Final exams available Apr. 29; due May 9 Outstanding work due May 9

### What will you do after May 9? Relax a minute or two

Several of you will want to start preparing for the Qualifier Exams which will be administered (tentative dates):

Monday, June 13 to Thursday, June 16 during the hours 1:00 – 4:00 pm.

Special topic: Electromagnetic properties of superconductors

Ref:D. Teplitz, editor, Electromagnetism – paths to research, Plenum Press (1982); Chapter 1 written by Brian Schwartz and Sonia Frota-Pessoa

#### History:

1908 H. Kamerlingh Onnes successfully liquified He

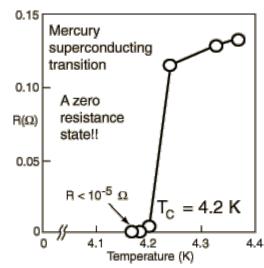

1911 H. Kamerlingh Onnes discovered that Hg at 4.2 K

has vanishing resistance

1957 Theory of superconductivity by Bardeen, Cooper,

and Schrieffer

The surprising observation was that electrical resistivity abruptly dropped when the temperature of the material was lowered below a critical temperature  $T_{\rm c}$ .

#### Fritz London 1900-1954

Fritz London, 1947, photo: Lotte Meitner-Graf

Fritz London, one of the most distinguished scientists on the Duke University faculty, was an internationally recognized theorist in Chemistry, Physics and the Philosophy of Science. He was born in Breslau, Germany (now Wroclaw, Poland) in 1900. In 1933 he was

He immigrated to the United States in 1939, and came to Duke University, first as a Professor of Chemistry. In 1949 he received a joint appointment in Physics and Chemistry and became a James B. Duke Professor. In 1953 he became the 5th recipient of the Lorentz medal, awarded by the Royal Netherlands Academy of Sciences, and was the first American citizen to receive this honor. He died in Durham in 1954.

https://phy.duke.edu/about/history/historical-faculty/fritz-london

#### Some phenomenological theories < 1957 thanks to F. London

Drude model of conductivity in "normal" materials

$$m\frac{d\mathbf{v}}{dt} = -e\mathbf{E} - m\frac{\mathbf{v}}{\tau}$$
$$\mathbf{v}(t) = \mathbf{v}_0 e^{-t/\tau} - \frac{e\mathbf{E}\,\tau}{m}$$

Note: Equations are in cgs Gaussian units.

$$\mathbf{J} = -ne\mathbf{v}; \quad \text{for } t >> \tau \quad \Rightarrow \quad \mathbf{J} = \frac{ne^2\tau}{m}\mathbf{E} \equiv \sigma \mathbf{E}$$

London model of conductivity in superconducting materials;  $\tau \to \infty$ 

$$m\frac{d\mathbf{v}}{dt} = -e\mathbf{E}$$

$$\frac{d\mathbf{v}}{dt} = -\frac{e\mathbf{E}}{m}$$

$$\frac{d\mathbf{v}}{dt} = -\frac{e\mathbf{E}}{m} \qquad \qquad \frac{d\mathbf{J}}{dt} = -ne\frac{d\mathbf{v}}{dt} = \frac{ne^2\mathbf{E}}{m}$$

From Maxwell's equations:

$$\nabla \times \mathbf{B} = \frac{4\pi}{c} \mathbf{J} + \frac{1}{c} \frac{\partial \mathbf{E}}{\partial t}$$

$$\nabla \times \mathbf{E} = -\frac{1}{c} \frac{\partial \mathbf{B}}{\partial t}$$

#### Properties of a normal metal

Drude model of conductivity in "normal" materials

$$m\frac{d\mathbf{v}}{dt} = -e\mathbf{E} - m\frac{\mathbf{v}}{\tau}$$

$$\mathbf{v}(t) = \mathbf{v}_0 e^{-t/\tau} - \frac{e\mathbf{E}\,\tau}{m}$$

$$\mathbf{J} = -ne\mathbf{v}; \qquad \text{for } t >> \tau \qquad \Rightarrow \qquad \mathbf{J} = \frac{ne^2\tau}{m}\mathbf{E} \equiv \sigma\mathbf{E}$$

Does this model allow for any temperature dependence on the resistivity?

- 1. No.
- 2. Yes.
- 3. Maybe.

London model of conductivity in superconducting materials;  $\tau \to \infty$ 

$$m\frac{d\mathbf{v}}{dt} = -e\mathbf{E}$$

$$\frac{d\mathbf{v}}{dt} = -\frac{e\mathbf{E}}{m}$$

$$\frac{d\mathbf{v}}{dt} = -\frac{e\mathbf{E}}{m} \qquad \qquad \frac{d\mathbf{J}}{dt} = -ne\frac{d\mathbf{v}}{dt} = \frac{ne^2\mathbf{E}}{m}$$

From Maxwell's equations:

$$\nabla \times \mathbf{B} = \frac{4\pi}{c} \mathbf{J} + \frac{1}{c} \frac{\partial \mathbf{E}}{\partial t}$$

$$\nabla \times \mathbf{E} = -\frac{1}{c} \frac{\partial \mathbf{B}}{\partial t}$$

How is the London model different from the Drude model?

- 1. Subtle difference.
- 2. Big difference.

### Some phenomenological theories < 1957

London model of conductivity in superconducting materials

$$\frac{d\mathbf{J}}{dt} = -ne\frac{d\mathbf{v}}{dt} = \frac{ne^2\mathbf{E}}{m}$$

From Maxwell's equations:

$$\nabla \times \mathbf{B} = \frac{4\pi}{c} \mathbf{J} + \frac{1}{c} \frac{\partial \mathbf{E}}{\partial t} \qquad \qquad \nabla \times \mathbf{E} = -\frac{1}{c} \frac{\partial \mathbf{B}}{\partial t}$$

$$\nabla \times \mathbf{E} = -\frac{1}{c} \frac{\partial \mathbf{B}}{\partial t}$$

$$\nabla \times (\nabla \times \mathbf{B}) = -\nabla^2 \mathbf{B} = \frac{4\pi}{c} \nabla \times \mathbf{J} - \frac{1}{c^2} \frac{\partial^2 \mathbf{B}}{\partial t^2}$$

$$-\nabla^2 \frac{\partial \mathbf{B}}{\partial t} = \frac{4\pi}{c} \nabla \times \frac{\partial \mathbf{J}}{\partial t} - \frac{1}{c^2} \frac{\partial^3 \mathbf{B}}{\partial t^3}$$

$$-\nabla^2 \frac{\partial \mathbf{B}}{\partial t} = \frac{4\pi n e^2}{mc} \nabla \times \mathbf{E} - \frac{1}{c^2} \frac{\partial^3 \mathbf{B}}{\partial t^3}$$

$$-\nabla^2 \frac{\partial \mathbf{B}}{\partial t} = -\frac{4\pi n e^2}{mc^2} \frac{\partial \mathbf{B}}{\partial t} - \frac{1}{c^2} \frac{\partial^3 \mathbf{B}}{\partial t^3}$$

$$\frac{\partial}{\partial t} \left( \nabla^2 - \frac{1}{\lambda_I^2} - \frac{1}{c^2} \frac{\partial^2}{\partial t^2} \right) \mathbf{B} = 0$$

#### Are these equations

- 1. Exact?
- 2. Approximate?
  - 3. Wrong?

with 
$$\lambda_L^2 \equiv \frac{mc^2}{4\pi ne^2}$$

#### London model – continued

London model of conductivity in superconducting materials

$$\frac{d\mathbf{J}}{dt} = -ne\frac{d\mathbf{v}}{dt} = \frac{ne^2\mathbf{E}}{m}$$

$$\frac{\partial}{\partial t} \left( \nabla^2 - \frac{1}{\lambda_L^2} - \frac{1}{c^2} \frac{\partial^2}{\partial t^2} \right) \mathbf{B} = 0 \qquad \text{with } \lambda_L^2 \equiv \frac{mc^2}{4\pi ne^2}$$

For slowly varying solution:

$$\frac{\partial}{\partial t} \left( \nabla^2 - \frac{1}{\lambda_L^2} \right) \mathbf{B} = 0 \qquad \text{for } \frac{\partial \mathbf{B}}{\partial t} = \hat{\mathbf{z}} \frac{\partial B_z(x,t)}{\partial t} :$$

$$\Rightarrow \frac{\partial B_z(x,t)}{\partial t} = \frac{\partial B_z(0,t)}{\partial t} e^{-x/\lambda_L}$$

London's leap:  $B_z(x,t) = B_z(0,t)e^{-x/\lambda_L}$ 

Here we assume we know the boundary value at x=0.

Consistent results for current density:

$$\frac{4\pi}{c}\nabla \times \mathbf{J} = -\nabla^2 \mathbf{B} = -\frac{1}{\lambda_L^2} \mathbf{B} \qquad \mathbf{J} = \hat{\mathbf{y}} J_y(x) \quad \Rightarrow \quad J_y(x) = \lambda_L \frac{ne^2}{mc} \mathbf{B}_z(0) e^{-x/\lambda_L}$$

#### London model - continued

Penetration length for superconductor:  $\lambda_L^2 = \frac{mc^2}{4\pi mc^2}$  Typically,  $\lambda_L \approx 10^{-7} m$ 

$$B_z(x,t) = B_z(0,t)e^{-x/\lambda_L}$$

Vector potential for  $\mathbf{B} = \nabla \times \mathbf{A}$  and  $\nabla \cdot \mathbf{A} = 0$ :

$$\mathbf{A} = \hat{\mathbf{y}}A_y(x)$$

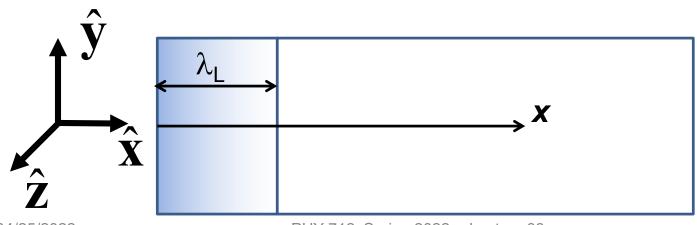

$$\mathbf{A} = \hat{\mathbf{y}} A_{v}(x) \qquad A_{v}(x) = -\lambda_{L} B_{z}(0) e^{-x/\lambda_{L}}$$

Note that: 
$$\nabla \times \mathbf{B} = \frac{4\pi}{c} \mathbf{J}$$

$$-\nabla^2 \mathbf{A} = \frac{4\pi}{c} \mathbf{J} \implies \nabla^2 \mathbf{A} + \frac{4\pi}{c} \mathbf{J} = 0$$

Recall form for current density:  $J_y(x) = \lambda_L \frac{ne^2}{\pi c} B_z(0) e^{-x/\lambda_L}$ 

$$\Rightarrow \mathbf{J} + \frac{ne^2}{mc} \mathbf{A} = 0 \quad \text{or} \quad \frac{ne}{m} \left( m\mathbf{v} + \frac{e}{c} \mathbf{A} \right) = 0$$

#### Behavior of superconducting material – exclusion of magnetic field according to the London model

Penetration length for superconductor:  $\lambda_L^2 = \frac{mc^2}{4\pi mc^2}$ 

$$B_z(x,t) = B_z(0,t)e^{-x/\lambda_L}$$

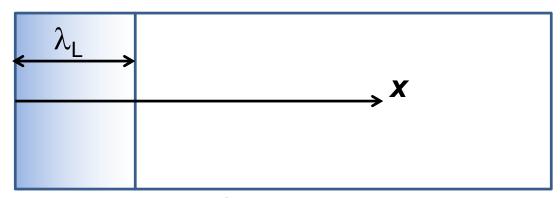

Vector potential for  $\nabla \cdot \mathbf{A} = 0$ :

$$\mathbf{A} = \hat{\mathbf{y}}A_{y}(x) \qquad A_{y}(x) = -\lambda_{L}B_{z}(0)e^{-x/\lambda_{L}}$$

 $\mathbf{A} = \hat{\mathbf{y}} A_y(x) \qquad A_y(x) = -\lambda_L B_z(0) e^{-x/\lambda_L}$ Current density:  $J_y(x) = \lambda_L \frac{ne^2}{mc} B_z(0) e^{-x/\lambda_L}$ 

$$\Rightarrow \mathbf{J} + \frac{ne^2}{mc} \mathbf{A} = 0 \quad \text{or} \quad \frac{ne}{m} \left( m\mathbf{v} + \frac{e}{c} \mathbf{A} \right) = 0$$

Typically,  $\lambda_I \approx 10^{-7} m$ 

#### Behavior of magnetic field lines near superconductor

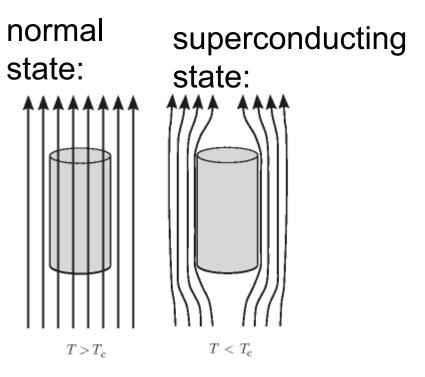

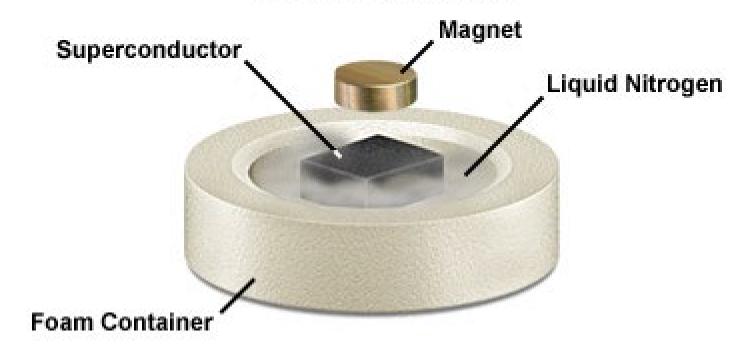

Figure 18.2 Exclusion of a weak external magnetic field from the interior of a superconductor.

#### The Meissner Effect

Need to consider phase equilibria between "normal" and superconducting state as a function of temperature and applied magnetic fields.

$$\mathbf{B} = \mathbf{H} + 4\pi \mathbf{M}$$

Within the superconductor, if  $\mathbf{B} = 0$ 

then 
$$\mathbf{H} + 4\pi \mathbf{M} = 0$$
 or  $\mathbf{M} = -\frac{\mathbf{H}}{4\pi}$ 

Magnetization field
Treating London current in terms of corresponding magnetization field M:

$$B=H+4\pi M$$

$$\Rightarrow$$
 For  $x >> \lambda_L$ ,  $\mathbf{H} = -4\pi\mathbf{M}$ ,  $\mathbf{M}(\mathbf{H}) = -\frac{\mathbf{H}}{4\pi}$  of in terms of an applied field.

Here H is thought

Gibbs free energy associated with magnetization for superconductor:

$$G_S(H_a) = G_S(H = 0) - \int_0^{H_a} dH M(H) = G_S(0) - \int_0^{H_a} dH \left(\frac{-H}{4\pi}\right) = G_S(0) + \frac{1}{8\pi} H_a^2$$

This relation is true for an applied field  $H_a \leq H_C$  when the superconducting and normal Gibbs free energies are equal:

$$G_{\mathcal{S}}(H_{\mathcal{C}}) = G_{\mathcal{N}}(H_{\mathcal{C}}) \approx G_{\mathcal{N}}(H=0)$$

Condition at phase boundary between normal and superconducting states:

$$G_{N}(H_{C}) \approx G_{N}(0) = G_{S}(H_{C}) = G_{S}(0) + \frac{1}{8\pi}H_{C}^{2} \qquad \text{At } T = 0K$$

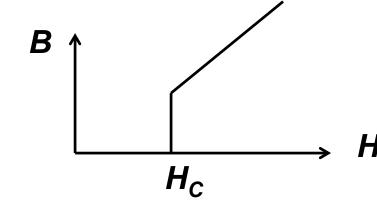

$$\Rightarrow G_{S}(0) - G_{N}(0) = -\frac{1}{8\pi}H_{C}^{2}$$

$$G_{S}(H_{a}) - G_{N}(H_{a}) = \begin{cases} -\frac{1}{8\pi}(H_{C}^{2} - H_{a}^{2}) & \text{for } H_{a} < H_{C} \\ 0 & \text{for } H_{a} > H_{C} \\ 0 & \text{PHY 712 Spring 2022 -- Lecture 33} \end{cases}$$

04/25/2022

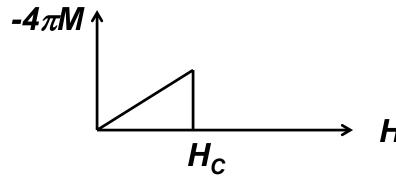

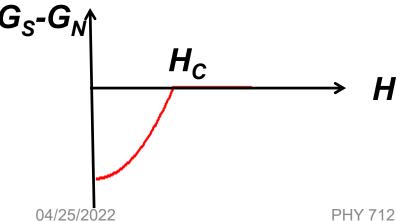

Magnetization field (for "type I" superconductor)

Inside superconductor

$$\mathbf{B}=0=\mathbf{H}+4\pi\mathbf{M}$$
 for  $H$ 

#### Theory of Superconductivity\*

J. BARDEEN, L. N. COOPER,† AND J. R. SCHRIEFFER‡ Department of Physics, University of Illinois, Urbana, Illinois (Received July 8, 1957)

$$G_S(0) - G_N(0) = -\frac{H_C^2}{8\pi} \approx -2N(E_F)(\hbar\omega)^2 e^{-2/(N(E_F)V)}$$

characteristic phonon energy

Type I superconductors:

$$H_c(T) = H_c(0) \left( 1 - \frac{T^2}{T_c^2} \right)$$

**Figure 18.3** Schematic phase diagram illustrating normal and superconducting regions of a type-I superconductor.

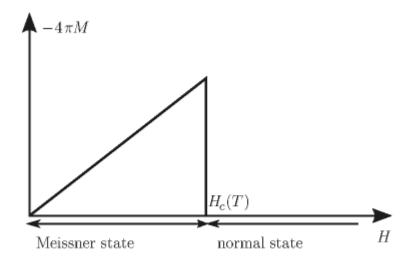

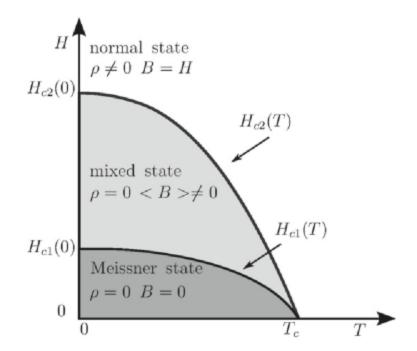

Figure 18.4 Magnetization versus applied field for type-I superconductors.

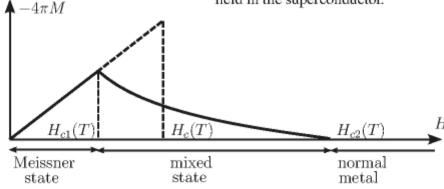

The following slides give a quick look of some of the intriguing aspects of superconducting materials and their properties --

#### Type II superconductors

**Figure 18.5** Schematic phase diagram illustrating normal, mixed and Meissner regions of a type-II superconductor (the vanishingly small resistivity of the mixed state occurs if flux lines are "pinned" by appropriate material defects); in the mixed state,  $\langle B \rangle$  denotes the average magnetic field in the superconductor.

**Figure 18.6** Magnetization versus applied field H for a type-II superconductor. The equivalent area construction of the thermodynamic field  $H_c(T)$  is also illustrated.

Quantization of current flux associated with the superconducting state (Ref: Ashcroft and Mermin, **Solid State Physics**)

From the London equations for the interior of the superconductor:

$$\left(m\mathbf{v} + \frac{e}{c}\mathbf{A}\right) = 0$$

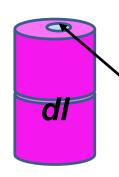

Now suppose that the current carrier is a pair of electrons characterized by a wavefunction of the form  $\psi = |\psi| e^{i\phi}$ 

The quantum mechanical current associated with the electron pair is

$$\mathbf{j} = -\frac{e\hbar}{2mi} \left( \psi^* \nabla \psi - \psi \nabla \psi^* \right) - \frac{2e^2}{mc} \mathbf{A} \left| \psi \right|^2$$
$$= -\left( \frac{e\hbar}{m} \nabla \phi + \frac{2e^2}{mc} \mathbf{A} \right) \left| \psi \right|^2$$

Quantization of current flux associated with the superconducting state -- continued

Suppose a superconducting material has a cylindrical void. Evaluate the integral of the current in a closed path within the superconductor containing the void.

$$\oint \mathbf{j} \cdot d\mathbf{l} = 0 = -\oint \left( \frac{e\hbar}{m} \nabla \phi + \frac{2e^2}{mc} \mathbf{A} \right) |\psi|^2 \cdot d\mathbf{l}$$

$$\oint \mathbf{A} \cdot d\mathbf{l} = \int (\nabla \times \mathbf{A}) \cdot d\mathbf{a} = \int \mathbf{B} \cdot d\mathbf{a} = \Phi \quad \text{magnetic flux}$$

$$\oint \nabla \phi \cdot d\mathbf{l} = 2\pi n \quad \text{for some integer } n$$

$$\Rightarrow$$
 Quantization of flux in the void:  $|\Phi| = n \frac{hc}{2e} \equiv n\Phi_0$ 

Such "vortex" fields can exist within type II superconductors.

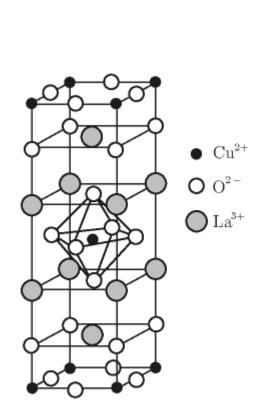

**Table 18.1** Critical temperature of some selected superconductors, and zero-temperature critical field. For elemental materials, the thermodynamic critical field  $H_c(0)$  is given in gauss. For the compounds, which are type-II superconductors, the upper critical field  $H_{c2}(0)$  is given in Tesla (1 T =  $10^4$  G). The data for metallic elements and binary compounds of V and Nb are taken from G. Burns (1992). The data for MgB<sub>2</sub> and iron pnictide are taken from the references cited in the text, and refer to the two principal crystallographic axes. The data for the other compounds are taken from D. R. Harshman and A. P. Mills, Phys. Rev. B 45, 10684 (1992)]. A more extensive list of data can be found in the mentioned references.

## Crystal structure of one of the high temperature superconductors

**Figure 18.1** Crystal structure of the ceramic material  $La_2CuO_4$ . Appropriately doped, lanthanum-based cuprates opened the path to high- $T_c$  superconductivity in 1986.

From MS thesis of Brent Howe (Minn State U, 2014)

### Some details of single vortex in type II superconductor London equation without vortices:

$$\frac{4\pi}{c}\nabla \times \mathbf{J} = -\nabla^2 \mathbf{B} = -\frac{1}{\lambda_L^2} \mathbf{B} \qquad \text{where} \quad \lambda_L^2 \equiv \frac{mc^2}{4\pi ne^2}$$

Equation for field with single quantum of vortex along z - axis:

$$\nabla^2 \mathbf{B} - \frac{1}{\lambda_I^2} \mathbf{B} = -\frac{\Phi_0}{\lambda_I^2} \hat{\mathbf{z}} \delta(\mathbf{r}) \qquad \Phi_0 = \frac{hc}{2e} \qquad \mathbf{r} = x\hat{\mathbf{x}} + y\hat{\mathbf{y}}$$

Solution: 
$$\mathbf{B}(\mathbf{r}) = \hat{\mathbf{z}} \frac{\Phi_0}{2\pi\lambda_L^2} K_0 \left( \frac{r}{\lambda_L} \right)$$

Check:

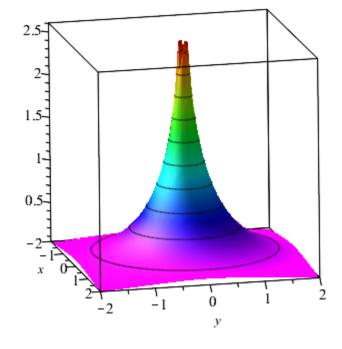

For 
$$r > 0$$
  $\left(\frac{d^2}{dr^2} + \frac{1}{r}\frac{d}{dr} - \frac{1}{\lambda_L^2}\right)K_0\left(\frac{r}{\lambda_L}\right) = 0$ 

For 
$$r \to 0$$
  $2\pi \int_0^r dr' r' \left( \frac{d^2}{dr^2} + \frac{1}{r} \frac{d}{dr} - \frac{1}{\lambda_L^2} \right) K_0 \left( \frac{r}{\lambda_L} \right) = -2\pi$ 

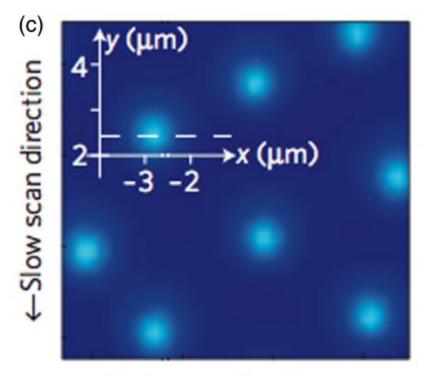

Since 
$$K_0(u) \underset{u \to 0}{\approx} -\ln u$$

$$\mathbf{B}(\mathbf{r}) = \hat{\mathbf{z}} \frac{\Phi_0}{2\pi\lambda_L^2} K_0 \left( \frac{r}{\lambda_L} \right)$$
