Problem with Ampère’s Law

Ampère’s Law

\[ \oint \mathbf{B} \cdot d\mathbf{s} = \mu_0 I \]

But there is a problem if \( I \) varies with time!

Consider a parallel plate capacitor

For \( S_1 \), \( \oint \mathbf{B} \cdot d\mathbf{s} = \mu_0 I \)

For \( S_2 \), \( \oint \mathbf{B} \cdot d\mathbf{s} = \mu_0 I = 0 \)

(No current in the gap)
Call \( I \) as the **conduction** current.

Specify a new current that exists when a change in the electric field occurs. Call it the **displacement** current.

\[
I_d = \varepsilon_0 \frac{d\Phi_E}{dt}
\]

Electrical flux through \( S_2 \):

\[
\Phi_E = EA = \left( \frac{Q}{\varepsilon_0 A} \right) A = \frac{Q}{\varepsilon_0}
\]

\[
I_d = \varepsilon_0 \frac{d\Phi_E}{dt} = \frac{dQ}{dt} = I
\]
Magnetic fields are produced by both conduction currents and by time-varying electrical fields.

Now the generalized form of Ampère’s Law, or Ampère-Maxwell Law becomes:

\[ \oint \mathbf{B} \cdot d\mathbf{s} = \mu_0 (I + I_d) = \mu_0 I + \mu_0 \varepsilon_0 \frac{d\Phi_E}{dt} \]
Maxwell’s Equations

\[ \oint \mathbf{E}.d\mathbf{A} = \frac{Q}{\varepsilon_0} \]

\[ \oint \mathbf{B}.d\mathbf{A} = 0 \]

\[ \oint \mathbf{E}.d\mathbf{s} = -\frac{d\Phi_B}{dt} \]

\[ \oint \mathbf{B}.d\mathbf{s} = \mu_0 I + \mu_0 \varepsilon_0 \frac{d\Phi_E}{dt} \]

\[ \mathbf{F} = q\mathbf{E} + q\mathbf{v} \times \mathbf{B} \]
By supplying short voltage bursts from the coil to the transmitter electrode we can ionize the air between the electrodes.

In effect, the circuit can be modeled as a LC circuit, with the coil as the inductor and the electrodes as the capacitor.

A receiver loop placed nearby is able to receive these oscillations and creates sparks as well.
Waves

Circular (or Spherical in 3D) Waves

Plane Waves
Electric and Magnetic Fields in Free Space

\[ \int \vec{E} \cdot d\vec{s} = -\frac{d\Phi_B}{dt} \]

\[ \int \vec{B} \cdot d\vec{s} = \mu_0 I + \mu_0 \varepsilon_0 \frac{d\Phi_E}{dt} \]

Free Space: \( I = 0, \quad Q = 0 \)

\[ \int \vec{B} \cdot d\vec{s} = \mu_0 \varepsilon_0 \frac{d\Phi_E}{dt} \]

\[ \frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t} \]

\[ \frac{\partial B}{\partial x} = -\mu_0 \varepsilon_0 \frac{\partial E}{\partial t} \]

\[ \frac{\partial^2 E}{\partial x^2} = -\frac{\partial}{\partial x} \left( \frac{\partial B}{\partial t} \right) = -\frac{\partial}{\partial t} \left( \frac{\partial B}{\partial x} \right) = -\frac{\partial}{\partial t} \left( -\mu_0 \varepsilon_0 \frac{\partial E}{\partial t} \right) \]

\[ \frac{\partial^2 B}{\partial x^2} = \mu_0 \varepsilon_0 \frac{\partial^2 E}{\partial t^2} \]

\[ \frac{\partial^2 B}{\partial x^2} = \mu_0 \varepsilon_0 \frac{\partial^2 B}{\partial t^2} \]

\[ E = E_{\text{max}} \cos(kx - \omega t) \]

\[ B = B_{\text{max}} \cos(kx - \omega t) \]
EM Wave Oscillation
Some Important Quantities

\[ c = \frac{1}{\sqrt{\mu_0 \varepsilon_0}} \quad \text{Speed of Light} \]

\[ \omega = 2\pi f \quad \text{Angular Frequency} \]

\[ \lambda = \frac{c}{f} \quad \text{Wavelength} \]

\[ k = \frac{2\pi}{\lambda} \quad \text{Wavenumber} \]

\[ \frac{\omega}{k} = c \]
Properties of EM Waves

The solutions to Maxwell’s equations in free space are wavelike.

Electromagnetic waves travel through free space at the speed of light.

The electric and magnetic fields of a plane wave are perpendicular to each other and the direction of propagation (they are transverse).

The ratio of the magnitudes of the electric and magnetic fields is $c$.

EM waves obey the superposition principle.

\[
\frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t}
\]

\[
\frac{\partial B}{\partial x} = -\mu_0 \varepsilon_0 \frac{\partial E}{\partial t}
\]

\[
E = E_{\text{max}} \cos(kx - \omega t)
\]

\[
B = B_{\text{max}} \cos(kx - \omega t)
\]

\[
kE_{\text{max}} = \omega B_{\text{max}}
\]

\[
\frac{E}{E_{\text{max}}} = \frac{\omega}{k} = c
\]

\[
\frac{B}{B_{\text{max}}} = \frac{\omega}{k} = c
\]
An EM Wave

a) \( \lambda = ?, \quad T = ? \)

\[
\lambda = \frac{c}{f} = \frac{3 \times 10^8}{40 \times 10^6} = 7.5\text{m}
\]

\[
T = \frac{1}{f} = \frac{1}{40 \times 10^6} = 2.5 \times 10^{-8}\text{s}
\]

b) If \( E_{\text{max}} = 750\text{N/C} \), then \( B_{\text{max}} = ? \)

\[
B_{\text{max}} = \frac{E_{\text{max}}}{c} = \frac{750}{3 \times 10^8} = 2.5 \times 10^{-6}\text{T}
\]

Directed towards the z-direction

c) \( E(t) = ? \) and \( B(t) = ? \)

\[
k = \frac{2\pi}{\lambda} = \frac{2\pi}{7.5} = 0.838\text{rad/m}
\]

\[
\omega = 2\pi f = 2\pi 40 \times 10^6 = 2.51 \times 10^8\text{rad/s}
\]

\[
E = E_{\text{max}} \cos(kx - \omega t) = (750\text{N/C})\cos(0.838x - 2.51 \times 10^8 t)
\]

\[
B = B_{\text{max}} \cos(kx - \omega t) = (2.5 \times 10^{-6}\text{T})\cos(0.838x - 2.51 \times 10^8 t)
\]
Energy Carried by EM Waves

\[ \vec{S} = \frac{1}{\mu_0} \vec{E} \times \vec{B} \]

Poynting Vector \((W/m^2)\)

\(S\) is equal to the rate of EM energy flow per unit area
(power per unit area)

For a plane EM Wave:

\[ S = \frac{EB}{\mu_0} = \frac{E^2}{\mu_0 c} = \frac{c}{\mu_0} B^2 \]

The average value of \(S\) is called the intensity:

\[ I = S_{av} = \frac{E_{max} B_{max}}{2\mu_0} = \frac{E_{max}^2}{2\mu_0 c} = \frac{c}{2\mu_0} B_{max}^2 \]
The Energy Density

\[ u_E = \frac{\varepsilon_0 E^2}{2} \]
\[ u_B = \frac{B^2}{2\mu_0} \]

\[ u_B = \frac{(E/c)^2}{2\mu_0} = \frac{\mu_0\varepsilon_0}{2\mu_0} E^2 = \frac{1}{2} \varepsilon_0 E^2 \]

\[ u_E = u_B = \frac{1}{2} \varepsilon_0 E^2 = \frac{B^2}{2\mu_0} \]

\[ u = u_E + u_B = \varepsilon_0 E^2 = \frac{B^2}{\mu_0} \]

\[ u_{av} = \varepsilon_0 \left( E^2 \right)_{av} = \frac{1}{2} \varepsilon_0 E_{\text{max}}^2 = \frac{B_{\text{max}}^2}{2\mu_0} \]

For an EM wave, the instantaneous electric and magnetic energies are equal.

Total Energy Density of an EM Wave

The intensity is \( c \) times the total average energy density.
Which gives the largest average energy density at the distance specified and thus, at least qualitatively, the best illumination

1. a 50-W source at a distance $R$.
2. a 100-W source at a distance $2R$.
3. a 200-W source at a distance $4R$. 
Fields on the Screen

\[ P_{\text{lamp}} = 150 \, \text{W}, \, 3\% \, \text{efficiency} \]
\[ A = 15 \, \text{m}^2 \]

\[ P_{av} = P_{\text{lamp}} \times 0.03 = 4.5\, \text{W} \]

\[ I = \frac{P_{av}}{A} = \frac{E_{\text{max}}}{2\mu_0 c} \]

\[ E_{\text{max}} = \sqrt{\frac{2\mu_0 c P_{av}}{A}} = 18.42\, \text{V/m} \]

\[ B_{\text{max}} = \frac{E_{\text{max}}}{c} = 6.14 \times 10^{-8} \, \text{T} \]
Momentum and Radiation Pressure

\[ p = \frac{T_{ER}}{c} \]  
Momentum for complete absorption

\[ P = \frac{F}{A} = \frac{1}{A} \frac{dp}{dt} \]  
Pressure on surface

\[ P = \frac{1}{A} \frac{d}{dt} \left( \frac{T_{ER}}{c} \right) = \frac{1}{c} \frac{dT_{ER}}{dt} / A \]

\[ P = \frac{S}{c} \]

For complete reflection:

\[ p = \frac{2T_{ER}}{c} \]
\[ P = \frac{2S}{c} \]
Pressure From a Laser Pointer

$P_{laser} = 3 \text{ mW}, 70\% \text{ reflection}, \ d = 2 \text{ mm}$

\begin{align*}
S &= \frac{P}{A} = \frac{0.003}{\pi (0.001^2)} = 955 \text{ W/m}^2 \\

P &= \frac{S}{c} + 0.7 \frac{S}{c} = 1.7 \frac{S}{c} \\

P &= 1.7 \frac{955}{3 \times 10^8} = 5.4 \times 10^{-6} \text{ N/m}^2
\end{align*}
The fundamental mechanism for electromagnetic radiation is an accelerating charge.
