# MTH 225: Homework \#8 

Due Date: April 12, 2024

1. Let $A \in M_{2 \times 2}(\mathbb{C})$ be given by

$$
A=\left[\begin{array}{cc}
5 / 2 & i / 2 \\
-i / 2 & 5 / 2
\end{array}\right]
$$

(a) Show that $A$ is Hermitian.
(b) Find the eigenvalues and eigenvectors of $A$.
(c) Show that $A$ is positive semidefinite.
(d) Find the square root of $A$.
2. Let $A \in M_{2 \times 2}(\mathbb{C})$ be given by

$$
A=\left[\begin{array}{ll}
3 & -3 \\
1 & -1
\end{array}\right]
$$

(a) Find an orthonormal basis for $\operatorname{ker}(A)$.
(b) Find an orthonormal basis for $\operatorname{im}(A)$.
(c) Find the SVD of $A$.
(d) Find the polar form of $A$.
3. Find $\exp (A)$ when $A$ is given by
(a) $A=\left[\begin{array}{cc}2 & 1 \\ 0 & -1\end{array}\right]$
(b) $A=\left[\begin{array}{cc}0 & -2 \\ 2 & 0\end{array}\right]$
(c) $A=\left[\begin{array}{ll}1 & 2 \\ 0 & 1\end{array}\right]$

Hint: The third matrix is not diagonalizable. You will have to use the definition of the $\exp (A)$ and find a pattern for the powers of $A$.
4. Prove for all $A \in M_{n \times n}(\mathbb{C})$ that $A \exp (A)=\exp (A) A$.
5. Prove that if $O$ is the $n \times n$ zero matrix then $\exp (O)=I$.
6. Prove for all $A \in M_{n \times n}(\mathbb{C})$ and $a, b \in \mathbb{R}$ that $\exp ((a+b) A)=\exp (a A) \exp (b A)$.
7. Prove for all $A \in M_{n \times n}(\mathbb{C})$ that $\exp (-A)=\exp (A)^{-1}$.
8. Prove for all $A \in M_{n \times n}(\mathbb{C})$ that $\exp \left(A^{*}\right)=\exp (A)^{*}$.
9. Prove that if $A \in M_{n \times n}(\mathbb{C})$ satisfies $A^{*}=-A$ then $\exp (A)$ is unitary.
10. Prove that if $A \in M_{n \times n}(\mathbb{C})$ is diagonalizable then

$$
\operatorname{det}(\exp (A))=e^{\operatorname{Tr}(A)}
$$

Hint: Recall that if $\lambda_{1}, \ldots, \lambda_{n}$ are the eigenvalues of $A$ then $\operatorname{Tr}(A)=\lambda_{1}+\ldots+\lambda_{n}$.
11. Consider the inconsistent system $A \vec{x}=\vec{b}$ when

$$
A=\left[\begin{array}{ccc}
1 & 1 & 0 \\
1 & 0 & -1 \\
0 & 1 & 1 \\
-1 & 1 & -1
\end{array}\right] \text { and } \vec{b}=\left[\begin{array}{l}
2 \\
5 \\
6 \\
6
\end{array}\right]
$$

(a) Find the associated normal equations.
(b) Find the least square solution to this system.
12. The median price (in thousands of dollars) of existing homes in a certain metropolitan area from 1989 to 1999 is summarized in the following table:

| year | 1989 | 1990 | 1991 | 1992 | 1993 | 1994 | 1995 | 1996 | 1997 | 1998 | 1999, |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| price | 86.4 | 89.8 | 92.8 | 96.0 | 99.6 | 103.1 | 106.3 | 109.5 | 113.3 | 120.0 | 129.5. |

(a) Set up the normal equations to find the least squares line for these data. Hint: Use a calculator or any kind of software to simplify the matrix computations.
(b) Solve the normal equations to find the least squares line for these data.
(c) Use your least squares line to estimate the median price of a house in 2005 and 2010.
13. A 20 pound turkey that is at the room temperature of $72^{\circ}$ is placed in the oven at $1: 00 \mathrm{PM}$. The temperature of the turkey is observed in 20 minute intervals to be $79^{\circ}, 88^{\circ}$, and $96^{\circ}$. A turkey is cooked when its temperature reaches $165^{\circ}$. Using least squares, estimate how much longer you have to wait until the turkey is done cooking.
